Open the campus portal

Verify the address lease, IP reachability, DNS answer and HTTP response separately.

CHECKPOINTS

- DHCP lease
- Gateway
- DNS answer
- HTTP page

1 Check client settings

Open the existing submission in Packet Tracer. On PC0, use Desktop > Command Prompt. Keep PC8-MGMT on its static address.

```
ipconfig /all
```

Check the Student subnet, default gateway and DNS server. R1 relays the DHCP broadcast to 192.168.10.130.

2 Reach the services subnet

From PC0, ping the server by IP. In the website, open Ping lab > Server access and pause at R1.

```
ping 192.168.10.130
```

The request enters R1 on VLAN 30 and leaves on VLAN 40. The recorded command received four replies.

3 Resolve the hostname

On PC0, query the local DNS service. Compare the result with SRV-CAMPUS > Services > DNS and Lab results A04.

```
nslookup portal.campus.test
```

Expect an A record for 192.168.10.130. The recorded end-to-end DNS check exercised UDP port 53.

4 Request the page

Open PC0 > Desktop > Web Browser. Enter the portal URL, select Go and compare the returned content with A05.

```
http://portal.campus.test
```

A rendered campus page verifies HTTP on TCP port 80. Record the returned page as well as the DNS answer.

TROUBLESHOOTING

If HTTP by IP works but the name fails, check the client DNS setting and A record. If DNS succeeds but the page fails by IP, inspect the HTTP service and TCP policy.
