Test a policy in both directions

Compare a blocked request, a permitted reverse request and a restricted management session.

CHECKPOINTS

- Student PC0
- Ingress ACL
- Admin PC8
- VTY access

1 Test the denied direction

In Access policy, select Students to Administration and replay the pair. Repeat from PC0 in Packet Tracer.

```
ping 192.168.10.98
```

R1 drops the incoming request from VLAN 30. The recorded PC0 command received zero of four replies.

2 Reverse the source

Read PC0's current address with ipconfig. On PC8-MGMT, ping that address. In Ping lab, select PC8-MGMT as source and PC0 as destination.

```
ping <current-PC0-IP>
```

Administration may initiate the diagnostic. The Student ingress ACL permits the returning ICMP Echo Reply.

3 Compare rule counters

On R1, inspect counters before and after a single denied ping. Use the rule names and source VLAN to identify the enforcement point.

```
show access-lists
```

A deny counter increase supports the drop. Website counter deltas marked capture-batch may include multiple commands.

4 Verify management access

From PC8-MGMT open SSH to R1, sign in with the local lab credentials, then exit. Repeat from PC9-ADMIN.

```
ssh -l netadmin 192.168.10.97
```

PC8 authenticates. PC9 is refused even though both are on VLAN 10. Compare Lab results A08 and A09.

CONTROL TEST

For a local control, ping a second Student PC from PC0. The access switch forwards within VLAN 30. No routed ACL is evaluated for that exchange.
